

CLAIMS

What is claimed is:

1 1. A method comprising:
2 within a first device, generating data for permanent storage in a protected area of
3 internal memory of the first device that prevents subsequent modification of the data;
4 and
5 within the first device, producing a secret value being a combination of both (1)
6 the data and (2) a short term value generated in response to a periodic event.

1 2. The method of claim 1 wherein prior to producing the secret value, the
2 method further comprises:
3 performing the periodic event; and
4 generating the short term value

1 3. The method of claim 1, wherein the periodic event includes a power-up
2 sequence by a platform employing the first device.

1 4. The method of claim 3, wherein prior to generating the data, the method
2 further comprises:
3 transmitting a first command from a second device to the first device.

1 5. The method of claim 4, wherein prior to producing the secret value, the
2 method further comprises:
3 transmitting the data to the second device.

1 6. The method of claim 5, wherein prior to producing the secret value, the
2 method further comprises:
3 transmitting a second command from a second device to the first device; and
4 generating the short term value internally within the first device in response to
5 the second command.

1 7. The method of claim 6, wherein prior to or concurrently with producing
2 the secret value, the method further comprises:

3 transmitting the short term value to the second device.

1 8. The method of claim 1, wherein the combination is a result produced by
2 successively performing a hash operation on both the data and the short term value.

1 9. A method comprising:
2 generating a long term value within a first device;
3 permanently storing the long term value within a protected area of an internal
4 memory of the first device;
5 providing the long term value to a second device communicatively coupled to
6 the first device;
7 generating a short term value within the first device, the short term value is
8 modified after each periodic event;
9 providing the short term value to the second device;
10 generating a secret value within the first device, the secret value being a
11 combination of both the long term value and the short term value; and
12 generating the secret value within the second device based on the long term
13 value and the short term value.

1 10. The method of claim 9, wherein the periodic event includes a power-up
2 sequence by a platform employing the first device.

1 11. The method of claim 9, wherein prior to generating the long term value,
2 the method further comprises:
3 transmitting a first command from the second device to the first device.

1 12. The method of claim 9, wherein the long term value is generated in
2 response to an initial power-up sequence when the first device is in communication
3 with the second device.

1 13. The method of claim 12, wherein prior generating the short term value,
2 the method further comprises:
3 transmitting a second command from the second device to the first device.

1 14. The method of claim 9, wherein the combination is a result produced by
2 successively performing a hashing operation on both the data and the short term value.

1 15. A platform comprising:
2 a link;
3 an input/output control hub (ICH) coupled to the link; and
4 a trusted platform module (TPM) coupled to the link, the TPM including
5 a package,
6 an asymmetric key generation unit contained within the package, the
7 asymmetric key generation unit to generate a long term value and a short term
8 value, and
9 an internal memory contained within the package, the internal memory
10 to permanently store the long term value and to temporarily store the short term
11 value and a secret value being a combination of the long term value and the
12 short term value.

1 16. The platform of claim 15, wherein the ICH including an internal
2 memory.

1 17. The platform of 16, wherein the TPM transmits the long term value to
2 the ICH over the link during manufacture of the platform and transmits the short term
3 value to the ICH over the link in response to a power-up sequence by the platform.

1 18. The platform of claim 15, wherein the asymmetric key generation unit of
2 the TPM includes a number generator.

1 19. The platform of claim 15, wherein the TPM further comprises a
2 cryptographic engine performing a successive hashing operation on both the long term
3 value and the short term value to produce the secret value.

1 20. A device comprising:
2 an internal memory; and
3 an asymmetric key generation unit to generate, in response to an initial event, a
4 unique long term value for permanent storage in a protected area of the internal memory

5 and to generate, in response to a periodic event, a short term value for storage in the
6 internal memory; and
7 a cryptographic engine to produce a secret value by combining both the long
8 term value and the short term value.

1 21. The device of claim 20, wherein the periodic event includes a power-up
2 sequence by a platform employing the device.

1 22. The device of claim 20, wherein the initial event includes an initial
2 power-up sequence of the device when in communication with another device.

1 23. The device of claim 20, wherein the internal memory includes a non-
2 volatile memory and a volatile memory.

1 24. The device of claim 20, wherein the cryptographic engine performs
2 successive hashing operations on the long term value and the short term value when
3 combining the long term value and the short term value.

1 25. A program loaded into platform readable memory for execution by a
2 first device of a platform, the program comprising:
3 code to generate data for permanent storage in a protected area of internal
4 memory of the first device in response to an initial event; and
5 code to produce a secret value being a combination of both the data and a short
6 term value that is generated in response to a periodic event.

1 26. The program of claim 25 further comprising:
2 code to generate the short term value in response to a periodic event.

1 27. The program of claim 25, wherein the periodic event includes a power-
2 up sequence by the platform.

1 28. The program of claim 25, wherein the initial event is a first power-up
2 sequence after the first device is in communication with a second device of the platform
3 for which the secret value is generated to create at least one secure communication
4 channel between the first device and the second device.
